1.7 Sqrt Tricks [8 lines] - addf19

1. Size of the block is not always Sqrt, adjust it as necessary. if $O(n/b+b)$ then take $n/b = b$ and calculate b .
2. MO's Algorithm
 - *it is possible to solve a Mo problem without any remove operation. For L in one block R only increases, for every range we can start L from the last of that block
3. Sqrt Decomposition by time of queries.
 - *keep overall solution and \sqrt{n} updates in a vector and for a query iterate over all of them, when the vector size exceeds \sqrt{n} you can add these updates with overall solution using $O(n)$
4. If sum of N positive numbers are S, there are at most \sqrt{S} distinct values.
5. Randomization
6. Baby step, gaint step

1.8 Treap [166 lines] - 8eef59

3.3 Flow [6 lines] - 6ebca7

Covering Problems:

- > Maximum Independent Set(Bipartite): Largest set of nodes which do not have any edge between them. sol: V-(MaxMatching)
- > Minimum Vertex Cover(Bipartite): -Smallest set of nodes to cover all the edges -sol: MaxMatching
- > Minimum Edge Cover(General graph): -Smallest set of edges to cover all the nodes -sol: V-(MaxMatching) (if edge cover exists, does not exist for isolated nodes)
- > Minimum Path Cover(Vertex disjoint) DAG: -Minimum number of vertex disjoint paths that visit all the nodes -sol: make a bipartite graph using same nodes in two sides, one side is "from" other is "to", add edges from "from" to "to", then ans is V-(MaxMatching)
- > Minimum Path Cover(Vertex Not Disjoint) General graph: -Minimum number of paths that visit all the nodes -sol: consider cycles as nodes then it will become a path cover problem with vertex disjoint on DAG

4 Game Theory

4.1 Points to be noted [14 lines] - 6fe124

```

>[First Write a Brute Force solution]
>Nim = all xor
>Misere Nim = Nim + corner case: if all piles are 1,
reverse(nim)

```

```

>Bogus Nim = Nim
>Staircase Nim = Odd indexed pile Nim (Even indexed pile
doesnt matter, as one player can give bogus moves to
drop all even piles to ground)
>Sprague Grundy: [Every impartial game under the normal
play convention is equivalent to a one-heap game of
nim]
Every tree = one nim pile = tree root value; tree leaf
value = 0; tree node value = mex of all child nodes.
[Careful: one tree node can become multiple new tree
roots(multiple elements in one node), then the value
of that node = xor of all those root values]
>Hackenbush(Given a rooted tree; cut an edge in one
move; subtree under that edge gets removed; last
player to cut wins):
Colon:  $//G(u) = (G(v1) + 1) \oplus (G(v2) + 1) \oplus \dots [v1, v2, \dots$ 
are childs of u]
For multiple trees ans is their xor
>Hackenbush on graph (instead of tree given an rooted
graph):
fusion: All edges in a cycle can be fused to get a tree
structure; build a super node, connect some single
nodes with that super node, number of single nodes
is the number of edges in the cycle.
Sol: [Bridge component tree] mark all bridges, a group
of edges that are not bridges, becomes one component
and contributes number of edges to the hackenbush.
(even number of edges contributes 0, odd number of
edges contributes 1)

```

8 Misc

8.1 Bit hacks [12 lines] - dd22ef

x & -x is the least bit in x.
iterate over all the subsets of the mask
for (int s=m; ; s=(s-1)&m) {
 ... you can use s ...
 if (s==0) break;
}
c = x&-x, r = x+c; (((r^x) >> 2)/c) | r is the next number after x with the same number of bits set.
__builtin_popcount(x) //number of ones in binary
__builtin_popcountll(x) // for long long
__builtin_clz(x) // number of leading zeros
__builtin_ctz(x) // number of trailing zeros, they also have long long version

8.2 Bitset C++ [13 lines] - a6a7a4

```

bitset<17>BS;
BS[1] = BS[7] = 1;
cout<<BS._Find_first()<<endl; // prints 1
bs._Find_next(idx). This function returns first set bit after index idx. for example:

```

```

bitset<17>BS;

```

```

BS[1] = BS[7] = 1;
cout<<BS._Find_next(1)<<'<<BS._Find_next(3)<<endl; // prints 7,7
So this code will print all of the set bits of BS:

for(int i=BS._Find_first();i< BS.size();i = BS._Find_next(i))
    cout<<i<<endl;
//Note that there isn't any set bit after idx, BS._Find_next(idx) will return BS.size(); same as calling BS._Find_first() when bitset is clear;

```

coprime $(k+1)$ -tuple together with n . It is a generalization of Euler's totient, $\phi(n) = J_1(n)$.

$$J_k(n) = n^k \prod_{p|n} \left(1 - \frac{1}{p^k}\right)$$

$$\sum_{d|n} J_k(d) = n^k$$

$$\sum_{d|n} \varphi(d) = n$$

$$\varphi(n) = \sum_{d|n} \mu(d) \cdot \frac{n}{d} = n \sum_{d|n} \frac{\mu(d)}{d}$$

- $a | b \implies \varphi(a) | \varphi(b)$
- $n | \varphi(a^n - 1)$ for $a, n > 1$
- $\varphi(mn) = \varphi(m)\varphi(n) \cdot \frac{d}{\varphi(d)}$ where $d = \gcd(m, n)$

Note the special cases

- $\varphi(2m) = \begin{cases} 2\varphi(m) & \text{if } m \text{ is even} \\ \varphi(m) & \text{if } m \text{ is odd} \end{cases}$
- $\varphi(n^m) = n^{m-1}\varphi(n)$

$$\varphi(\text{lcm}(m, n)) \cdot \varphi(\gcd(m, n)) = \varphi(m) \cdot \varphi(n)$$

Compare this to the formula

$$\text{lcm}(m, n) \cdot \gcd(m, n) = m \cdot n$$

(See [least common multiple](#).)

- $\varphi(n)$ is even for $n \geq 3$. Moreover, if n has r distinct odd prime factors, $2^r | \varphi(n)$

```

    ///n / x yields the same value for i <= x <= la.
}
return 0;
}

```

Mobius Function and Inversion

Notes

- For any positive integer n , define $\mu(n)$ as the sum of the primitive n th roots of unity. It has values in $\{-1, 0, 1\}$ depending on the factorization of n into prime factors:
 - ✓ $\mu(n) = 1$ if n is a square-free positive integer with an even number of prime factors.
 - ✓ $\mu(n) = -1$ if n is a square-free positive integer with an odd number of prime factors.
 - ✓ $\mu(n) = 0$ if n has a squared prime factor.

Here, a root of unity, occasionally called a de Moivre number, is any complex number that gives 1 when raised to some positive integer power n .

An n th root of unity, where n is a positive integer (i.e. $n = 1, 2, 3, \dots$), is a number z (maybe complex) satisfying the equation $z^n = 1$.

An n th root of unity is said to be primitive if it is not a k th root of unity for some smaller k , that is if

$$z^n = 1 \quad \text{and} \quad z^k \neq 1 \quad \text{for } k = 1, 2, 3, \dots, n-1.$$

- It is a multiplicative function.

$$\sum_{d|n} \mu(d) = \begin{cases} 1 & \text{if } n = 1, \\ 0 & \text{if } n > 1. \end{cases}$$

$$\varphi(n) = \sum_{d|n} d \mu\left(\frac{n}{d}\right)$$

$$\sum_{d|n} \frac{\mu^2(d)}{\varphi(d)} = \frac{n}{\varphi(n)}$$

$$\sum_{\substack{1 \leq k \leq n \\ \gcd(k, n) = 1}} k = \frac{1}{2} n \varphi(n) \quad \text{for } n > 1$$

$$\frac{\varphi(n)}{n} = \frac{\varphi(\text{rad}(n))}{\text{rad}(n)}$$

- where,

$$\text{rad}(n) = \prod_{\substack{p|n \\ p \text{ prime}}} p$$

- $\left\lfloor \frac{n}{\varphi(n)} \right\rfloor$ is periodic. 1, 2, 1, 2, 1, 3, 1, 2, 1, 2, 1, 3, ...

$$\sum_{\substack{1 \leq k \leq n \\ \gcd(k, n) = 1}} \gcd(k-1, n) = \varphi(n) d(n)$$

- where $d(n)$ is number of divisors.
- same equation for $\gcd(ak-1, n)$ where a and n are coprime.
- for every n there is at least one other integer $m \neq n$ such that $\phi(m) = \phi(n)$.

Divisor function

$$\sigma_x(n) = \sum_{d|n} d^x$$

- It is multiplicative i.e. if $\gcd(a, b) = 1 \implies \sigma_x(ab) = \sigma_x(a)\sigma_x(b)$.

$$\begin{aligned} \sum_{i=1}^n [\gcd(i, n) = k] &= \varphi\left(\frac{n}{k}\right) \\ \sum_{k=1}^n \gcd(k, n) &= \sum_{d|n} d \cdot \varphi\left(\frac{n}{d}\right) \\ \sum_{k=1}^n \frac{1}{\gcd(k, n)} &= \sum_{d|n} \frac{1}{d} \cdot \varphi\left(\frac{n}{d}\right) = \frac{1}{n} \sum_{d|n} d \cdot \varphi(d) \\ \sum_{k=1}^n \frac{k}{\gcd(k, n)} &= \frac{n}{2} \cdot \sum_{d|n} \frac{1}{d} \cdot \varphi\left(\frac{n}{d}\right) = \frac{n}{2} \cdot \frac{1}{n} \cdot \sum_{d|n} d \cdot \varphi(d) \\ \sum_{k=1}^n \frac{n}{\gcd(k, n)} &= 2 \cdot \sum_{k=1}^n \frac{k}{\gcd(k, n)} - 1, \text{ for } n > 1 \end{aligned}$$

- Given several integers, with integer x appears c_x times, and some fixed integer m . It is asked that how many integers that are co-prime to m , so,

$$\sum_{i=1}^n c_i [\gcd(i, m) = 1] = \sum_{d|m} \mu(d) \sum_{i=1}^{\lfloor n/d \rfloor} c_{id}$$

The classic version states that if g and f are arithmetic functions satisfying

$$g(n) = \sum_{d|n} f(d) \quad \text{for every integer } n \geq 1$$

then

$$f(n) = \sum_{d|n} \mu(d) g\left(\frac{n}{d}\right) \quad \text{for every integer } n \geq 1$$

- $\sum_{d|n} \mu(d) = [n = 1]$
- $\sum_{i=1}^n \sum_{j=1}^n [\gcd(i, j) = 1] = \sum_{d=1}^n \mu(d) \left\lfloor \frac{n}{d} \right\rfloor^2$
- $\sum_{i=1}^n \sum_{j=1}^n \gcd(i, j) = \sum_{d=1}^n \varphi(d) \left\lfloor \frac{n}{d} \right\rfloor^2$
- if $F(n) = \prod_{d|n} f(d)$, then $f(n) = \prod_{d|n} F\left(\frac{n}{d}\right)^{\mu(d)}$

mobius function

int mob[N];

void mobius()

- Any three consecutive Fibonacci numbers are pairwise coprime, which means that, for every n , $\gcd(F_n, F_{n+1}) = \gcd(F_n, F_{n+2}) = \gcd(F_{n+1}, F_{n+2}) = 1$.

- If p is a prime,

$$\begin{cases} p = 5 & \implies p | F_p, \\ p \equiv \pm 1 \pmod{5} & \implies p | F_{p-1} \\ p \equiv \pm 2 \pmod{5} & \implies p | F_{p+1} \end{cases}$$

- The only nontrivial square Fibonacci number is 144. Attila Pethő proved in 2001 that there is only a finite number of perfect power Fibonacci numbers. In 2006, Y. Bugeaud, M. Mignotte, and S. Siksek proved that 8 and 144 are the only such non-trivial perfect powers.
- If the members of the Fibonacci sequence are taken mod n , the resulting sequence is periodic with period at most $6n$.

Sum of floors

$$\sum_{i=1}^n \left\lfloor \frac{n}{i} \right\rfloor = ?$$

```

int32_t main()
{
    BeatMeScanf;
    int i, j, k, n, m;
    cin >> n;
    ///complexity O(sqrt(n))
    for (int i = 1, last; i <= n; i = last + 1) {
        last = n / (n / i);
        debug(i, last, n/i);
    }
}

```

```

{
    for(int i=1; i<N; i++) mob[i]=3;
    mob[1]=1;
    for(int i=2; i<N; i++){
        if(mob[i]==3){
            mob[i]=-1;
            for(int j=2*i; j<N; j+=i) mob[j]=(mob[j]==3?-1:mob[j]*(-1));
            if(i<=(N-1)/i) for(int j=i*i; j<N; j+=i*i) mob[j]=0;
        }
    }
}

```

GCD and LCM

$$\gcd(a, 0) = a$$

$$\gcd(a, b) = \gcd(b, a \bmod b)$$

- Every common divisor of a and b is a divisor of $\gcd(a, b)$.
- If a divides the product $b \cdot c$, and $\gcd(a, b) = d$, then a/d divides c .
- If m is any integer, then $\gcd(a + m \cdot b, b) = \gcd(a, b)$
- The gcd is a multiplicative function in the following sense: if a_1 and a_2 are relatively prime, then $\gcd(a_1 \cdot a_2, b) = \gcd(a_1, b) \cdot \gcd(a_2, b)$.
- $\gcd(a, b) \cdot \text{lcm}(a, b) = |a \cdot b|$
- $\gcd(a, \text{lcm}(b, c)) = \text{lcm}(\gcd(a, b), \gcd(a, c))$
- $\text{lcm}(a, \gcd(b, c)) = \gcd(\text{lcm}(a, b), \text{lcm}(a, c))$.
- For non-negative integers a and b , where a and b are not both zero,

$$\gcd(n^a - 1, n^b - 1) = n^{\gcd(a, b)} - 1.$$

$$r_8(n) = 16 \sum_{d|n} (-1)^{n+d} d^3$$

Gauss Circle Theorem

- The Gauss circle problem is the problem of determining how many integer lattice points there are in a circle centered at the origin and with radius r .
- Since the equation of this circle is given in Cartesian coordinates by $x^2 + y^2 = r^2$, the question is equivalently asking how many pairs of integers m and n there are such that $m^2 + n^2 \leq r^2$
- If the answer for a given r is denoted by $N(r)$ then

$$N(r) = 1 + 4 \sum_{i=0}^{\infty} \left(\left\lfloor \frac{r^2}{4i+1} \right\rfloor - \left\lfloor \frac{r^2}{4i+3} \right\rfloor \right)$$
- A much simpler sum appears if the sum of squares function $r_2(n)$ is defined as the number of ways of writing the number n as the sum of two squares. Then

$$N(r) = \sum_{n=0}^{r^2} r_2(n).$$

3. Combinatorics

Notes

- $\sum_{0 \leq k \leq n} \binom{n-k}{k} = \text{Fib}_{n+1}$
- $\binom{n}{k} = \binom{n}{n-k}$
- $\binom{n}{k} + \binom{n}{k+1} = \binom{n+1}{k+1}$
- $k \binom{n}{k} = n \binom{n-1}{k-1}$

- $\binom{n}{k} = \frac{n!}{k!(n-k)!}$
- $\sum_{i=0}^n \binom{n}{i} = 2^n$
- $\sum_{i \geq 0} \binom{n}{2i} = 2^{n-1}$
- $\sum_{i \geq 0} \binom{n}{2i+1} = 2^{n-1}$
- $\sum_{i=0}^k (-1)^i \binom{n}{i} = (-1)^k \binom{n-1}{k}$
- $\sum_{i=0}^k \binom{n+i}{i} = \binom{n+k+1}{k}$
- $\sum_{i=0}^k \binom{n+i}{n} = \binom{n+k+1}{k}$
- $\sum_{i=0}^k \binom{i}{n} = \binom{k+1}{n+1}$
- $1 \cdot \binom{n}{1} + 2 \cdot \binom{n}{2} + 3 \cdot \binom{n}{3} + \dots + n \cdot \binom{n}{n} = n \cdot 2^{n-1}$
- $1^2 \cdot \binom{n}{1} + 2^2 \cdot \binom{n}{2} + 3^2 \cdot \binom{n}{3} + \dots + n^2 \cdot \binom{n}{n} = (n+1) \cdot 2^{n-2}$
- Vandermonde's Identity: $\sum_{k=0}^r \binom{m}{k} \binom{n}{r-k} = \binom{m+n}{r}$
- Hockey-Stick

$$n, r \in \mathbb{N}, n > r, \sum_{i=r}^n \binom{i}{r} = \binom{n+1}{r+1}$$

Identity:

$$\sum_{i=0}^k \binom{k}{i}^2 = \binom{2k}{k}$$

- $\sum_{k=0}^n \binom{n}{k} \binom{n}{n-k} = \binom{2n}{n}$
- $\sum_{k=q}^n \binom{n}{k} \binom{k}{q} = 2^{n-q} \binom{n}{q}$
- $\sum_{i=0}^n 3^i \binom{n}{i} = 4^n$
- $\sum_{i=0}^n \binom{2n}{i} = 2^{2n-1} + \frac{1}{2} \binom{2n}{n}$
- $\sum_{i=1}^n \binom{n}{i} \binom{n-1}{i-1} = \binom{2n-1}{n-1}$

- $\sum_{i=0}^n \binom{2n}{i}^2 = \frac{1}{2} \left\{ \binom{4n}{2n} + \binom{2n}{n}^2 \right\}$
- An integer $n \geq 2$ is prime if and only if all the intermediate binomial coefficients $\binom{n}{1}, \binom{n}{2}, \dots, \binom{n}{n-1}$ are divisible by n .
- $\binom{n+k}{k}$ divides $\frac{\text{lcm}(n, n+1, \dots, n+k)}{n}$
- Kummer's theorem states that for given integers $n \geq m \geq 0$ and a prime number p , the largest power of p dividing $\binom{n}{m}$ is equal to the number of carries when m is added to $n - m$ in base p .
- Number of different binary sequences of length n such that no two 0's are adjacent = Fib_{n+1}
- Combination with repetition: Let's say we choose k elements from an n -element set, the order doesn't matter and each element can be chosen more than once. In that case, the number of different combinations is: $\binom{n+k-1}{k}$
- Number of ways to divide n different persons in n/k equal groups i.e. each having size k is $\binom{n-1}{k-1}$
- The number non-negative solution of the equation $x_1 + x_2 + x_3 + \dots + x_k = n$ is $\binom{n+k-1}{n}$
- Number of binary sequence of length n and with k '1' is $\binom{n}{k}$
- The number of ordered pairs (a, b) of binary sequences of length n , such that the distance between them is k , can be

$$\binom{n}{k} \cdot 2^n$$

calculated as follows:
The distance between a and b is the number of components that differs in a and b — for example, the distance between $(0, 0, 1, 0)$ and $(1, 0, 1, 1)$ is 2).

Catalan numbers

- $C_n = \frac{1}{n+1} \binom{2n}{n}$
- $C_0 = 1, C_1 = 1$ and $C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k}$
- 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786
- Number of correct bracket sequence consisting of n opening and n closing brackets.
- The number of ways to completely parenthesize $n+1$ factors.
- The number of triangulations of a convex polygon with $n+2$ sides (i.e. the number of partitions of polygon into disjoint triangles by using the diagonals).
- The number of ways to connect the $2n$ points on a circle to form n disjoint i.e. non-intersecting chords.
- The number of monotonic lattice paths from point $(0,0)$ to point (n,n) in a square lattice of size $n \times n$, which do not pass above the main diagonal (i.e. connecting $(0,0)$ to (n,n)).
- Number of permutations of length n that can be stack sorted (i.e. it can be shown that the

rearrangement is stack sorted if and only if there is no such index $i < j < k$, such that $a_k < a_i < a_j$).

- ✓ The number of **non-crossing partitions** of a set of n elements.
- ✓ The number of rooted full binary trees with $n+1$ leaves (vertices are not numbered). A rooted binary tree is full if every vertex has either two children or no children.
- ✓ The number of Dyck words of length $2n$. A Dyck word is a string consisting of n X's and n Y's such that no initial segment of the string has more Y's than X's. For example, the following are the Dyck words of length 6: XXXYYY XYXXYY XYXYXY XYYXXY XXYXYY.
- ✓ The number of different ways a convex polygon with $n+2$ sides can be cut into triangles by connecting vertices with straight lines (a form of Polygon triangulation)
- ✓ Number of permutations of $\{1, \dots, n\}$ that avoid the pattern 123 (or any of the other patterns of length 3); that is, the number of permutations with no three-term increasing subsequence. For $n = 3$, these permutations are 132, 213, 231, 312 and 321. For $n = 4$, they are 1432, 2143, 2413, 2431, 3142, 3214, 3241, 3412, 3421, 4132, 4213, 4231, 4312 and 4321
- ✓ Number of ways to tile a staircase shape of height n with n rectangles.

$$\checkmark N(n, k) = \frac{1}{n} \binom{n}{k} \binom{n}{k-1}$$

- ✓ The number of expressions containing n pairs of parentheses, which are correctly matched and which contain k distinct nestings. For instance, $N(4, 2) = 6$ as with four pairs of parentheses six sequences can be created which each contain two times the sub-pattern '()':

$((())) ((()())) ((()())) ((()())) ((()())) ((()()))$

- ✓ The number of paths from $(0, 0)$ to $(2n, 0)$, with steps only northeast and southeast, not straying below the x -axis, with k peaks. And sum of all number of peaks is Catalan number.

Stirling numbers of the first kind

- ✓ The Stirling numbers of the first kind count permutations according to their number of cycles (counting fixed points as cycles of length one).
- ✓ $S(n, k)$ counts the number of permutations of n elements with k disjoint cycles.
- ✓ $S(n, k) = (n-1) * S(n-1, k) + S(n-1, k-1)$, where $S(0, 0) = 1, S(n, 0) = S(0, n) = 0$
- ✓ $\sum_{k=0}^n S(n, k) = n!$

Stirling numbers of the second kind

- ✓ Stirling number of the second kind is the number of ways to **partition a set** of n objects into k non-empty subsets.
- ✓ $S(n, k) = k * S(n-1, k) + S(n-1, k-1)$,
where $S(0, 0) = 1, S(n, 0) = S(0, n) = 0$
- ✓ $S(n, 2) = 2^{n-1} - 1$
- ✓ $S(n, k) * k!$ = number of ways to color n nodes using colors from 1 to k such that each color is used at least once.

Bell number

- ✓ Counts the number of partitions of a set.
- ✓ $B_{n+1} = \sum_{k=0}^n \binom{n}{k} * B_k$
- ✓ $B_n = \sum_{k=0}^n S(n, k)$, where $S(n, k)$ is stirling number of second kind.
- ✓ The number of multiplicative partitions of a **squarefree** number with i prime factors is the i -th Bell number, B_i .
- ✓ If a deck of n cards is shuffled by repeatedly removing the top card and reinserting it anywhere in the deck (including its original position at the top of the deck), with exactly n repetitions of this operation, then there are n^n different shuffles that can be performed. Of these, the number that return the deck to its original sorted order is exactly B_n . Thus, the probability that the deck is in its original order after shuffling it in this way is B_n/n^n .

Lucas Theorem

- ✓ If p is prime the $\binom{p^a}{k} \equiv 0 \pmod{p}$
- ✓ For non-negative integers m and n and a prime p , the following congruence relation holds:

$$\binom{n}{m} \equiv \prod_{i=0}^k \binom{m_i}{n_i} \pmod{p},$$

where,

$$m = m_k p^k + m_{k-1} p^{k-1} + \dots + m_1 p + m_0,$$

and

$$n = n_k p^k + n_{k-1} p^{k-1} + \dots + n_1 p + n_0$$

are the base p expansions of m and n respectively. This uses the convention that $\binom{m}{n} = 0$, when $m < n$.

Derangement

- ✓ A derangement is a permutation of the elements of a set, such that no element appears in its original position.
- ✓ $d(n) = (n-1) * (d(n-1) + d(n-2))$,
where $d(0) = 1, d(1) = 0$
- ✓ $d(n) = \left\lfloor \frac{n!}{e} \right\rfloor, n \geq 1$

4. Burnside Lemma

The task is to count the number of different necklaces from n beads, each of which can be painted in one of the k colors. When comparing two necklaces, they can be rotated, but not reversed (i.e. a cyclic shift is permitted).

Solution:

Geometry

Projective coordinates: triples (x, y, z) , not all x, y and z zero.

$$(x, y, z) = (cx, cy, cz) \quad \forall c \neq 0.$$

Cartesian Projective

$$(x, y) \quad (x, y, 1)$$

$$y = mx + b \quad (m, -1, b)$$

$$x = c \quad (1, 0, -c)$$

Distance formula, L_p and L_∞ metric:

$$\sqrt{(x_1 - x_0)^2 + (y_1 - y_0)^2},$$

$$\left[|x_1 - x_0|^p + |y_1 - y_0|^p \right]^{1/p},$$

$$\lim_{p \rightarrow \infty} \left[|x_1 - x_0|^p + |y_1 - y_0|^p \right]^{1/p}.$$

Area of triangle (x_0, y_0) , (x_1, y_1) and (x_2, y_2) :

$$\frac{1}{2} \text{abs} \begin{vmatrix} x_1 - x_0 & y_1 - y_0 \\ x_2 - x_0 & y_2 - y_0 \end{vmatrix}.$$

Angle formed by three points:

$$\cos \theta = \frac{(x_1, y_1) \cdot (x_2, y_2)}{l_1 l_2}.$$

Line through two points (x_0, y_0) and (x_1, y_1) :

$$\begin{vmatrix} x & y & 1 \\ x_0 & y_0 & 1 \\ x_1 & y_1 & 1 \end{vmatrix} = 0.$$

Area of circle, volume of sphere:

$$A = \pi r^2, \quad V = \frac{4}{3} \pi r^3.$$

Identities Cont.

$$\begin{aligned} 38. \quad \binom{n+1}{m+1} &= \sum_k \binom{n}{k} \binom{k}{m} = \sum_{k=0}^n \binom{k}{m} n^{\overline{n-k}} = n! \sum_{k=0}^n \frac{1}{k!} \binom{k}{m}, & 39. \quad \begin{bmatrix} x \\ x-n \end{bmatrix} &= \sum_{k=0}^n \left\langle \begin{matrix} n \\ k \end{matrix} \right\rangle \binom{x+k}{2n}, \\ 40. \quad \left\{ \begin{matrix} n \\ m \end{matrix} \right\} &= \sum_k \binom{n}{k} \left\{ \begin{matrix} k+1 \\ m+1 \end{matrix} \right\} (-1)^{n-k}, & 41. \quad \begin{bmatrix} n \\ m \end{bmatrix} &= \sum_k \begin{bmatrix} n+1 \\ k+1 \end{bmatrix} \binom{k}{m} (-1)^{m-k}, \\ 42. \quad \left\{ \begin{matrix} m+n+1 \\ m \end{matrix} \right\} &= \sum_{k=0}^m k \left\{ \begin{matrix} n+k \\ k \end{matrix} \right\}, & 43. \quad \begin{bmatrix} m+n+1 \\ m \end{bmatrix} &= \sum_{k=0}^m k(n+k) \begin{bmatrix} n+k \\ k \end{bmatrix}, \\ 44. \quad \binom{n}{m} &= \sum_k \left\{ \begin{matrix} n+1 \\ k+1 \end{matrix} \right\} \begin{bmatrix} k \\ m \end{bmatrix} (-1)^{m-k}, & 45. \quad (n-m)! \binom{n}{m} &= \sum_k \begin{bmatrix} n+1 \\ k+1 \end{bmatrix} \left\{ \begin{matrix} k \\ m \end{matrix} \right\} (-1)^{m-k}, \quad \text{for } n \geq m, \\ 46. \quad \left\{ \begin{matrix} n \\ n-m \end{matrix} \right\} &= \sum_k \binom{m-n}{m+k} \binom{m+n}{n+k} \begin{bmatrix} m+k \\ k \end{bmatrix}, & 47. \quad \begin{bmatrix} n \\ n-m \end{bmatrix} &= \sum_k \binom{m-n}{m+k} \binom{m+n}{n+k} \left\{ \begin{matrix} m+k \\ k \end{matrix} \right\}, \\ 48. \quad \left\{ \begin{matrix} n \\ \ell+m \end{matrix} \right\} \binom{\ell+m}{\ell} &= \sum_k \left\{ \begin{matrix} k \\ \ell \end{matrix} \right\} \left\{ \begin{matrix} n-k \\ m \end{matrix} \right\} \binom{n}{k}, & 49. \quad \begin{bmatrix} n \\ \ell+m \end{bmatrix} \binom{\ell+m}{\ell} &= \sum_k \begin{bmatrix} k \\ \ell \end{bmatrix} \begin{bmatrix} n-k \\ m \end{bmatrix} \binom{n}{k}. \end{aligned}$$

Trees

Every tree with n vertices has $n-1$ edges.

Kraft inequality: If the depths of the leaves of a binary tree are d_1, \dots, d_n :

$$\sum_{i=1}^n 2^{-d_i} \leq 1,$$

and equality holds only if every internal node has 2 sons.

$$\sum_{d|n} d = O(n \log \log n).$$

The number of divisors of n is at most around 100 for $n < 5e4$, 500 for $n < 1e7$, 2000 for $n < 1e10$, 200 000 for $n < 1e19$.

IntPerm.h

Description: Permutation \rightarrow integer conversion. (Not order preserving.)

Time: $O(n)$

6 lines

```
int permToInt(vi& v) {
    int use = 0, i = 0, r = 0;
    trav(x,v) r=r * ++i + __builtin_popcount(use & ~(1 << x)),
        use |= 1 << x; // (note: minus, not ~!)
    return r;
} // hash-cpp-all = elb8eaea02324af14a3da94f409019b8
```

5.1.2 Cycles

Let $g_S(n)$ be the number of n -permutations whose cycle lengths all belong to the set S . Then

$$\sum_{n=0}^{\infty} g_S(n) \frac{x^n}{n!} = \exp \left(\sum_{n \in S} \frac{x^n}{n} \right)$$

5.1.3 Derangements

Permutations of a set such that none of the elements appear in their original position.

$$D(n) = (n-1)(D(n-1)+D(n-2)) = nD(n-1)+(-1)^n = \left\lfloor \frac{n!}{e} \right\rfloor$$

5.1.4 Burnside's lemma

Given a group G of symmetries and a set X , the number of elements of X up to symmetry equals

$$\frac{1}{|G|} \sum_{g \in G} |X^g|,$$

where X^g are the elements fixed by g ($g.x = x$).

Sums of powers:

$$\sum_{i=1}^n i^m = \frac{1}{m+1} \sum_{k=0}^m \binom{m+1}{k} B_k (n+1)^{m+1-k}$$

Euler-Maclaurin formula for infinite sums:

$$\begin{aligned} \sum_{i=m}^{\infty} f(i) &= \int_m^{\infty} f(x) dx - \sum_{k=1}^{\infty} \frac{B_k}{k!} f^{(k-1)}(m) \\ &\approx \int_m^{\infty} f(x) dx + \frac{f(m)}{2} - \frac{f'(m)}{12} + \frac{f'''(m)}{720} + O(f^{(5)}(m)) \end{aligned}$$

5.3.2 Stirling numbers of the first kind

Number of permutations on n items with k cycles.

$$c(n, k) = c(n-1, k-1) + (n-1)c(n-1, k), \quad c(0, 0) = 1$$

$$\sum_{k=0}^n c(n, k) x^k = x(x+1) \dots (x+n-1)$$

$$c(8, k) =$$

$$8, 0, 5040, 13068, 13132, 6769, 1960, 322, 28, 1$$

$$c(n, 2) =$$

$$0, 0, 1, 3, 11, 50, 274, 1764, 13068, 109584, \dots$$

5.3.3 Eulerian numbers

Number of permutations $\pi \in S_n$ in which exactly k elements are greater than the previous element. k j :s s.t.

$$\pi(j) > \pi(j+1), \quad k+1 \text{ } j\text{:s s.t. } \pi(j) \geq j, \quad k \text{ } j\text{:s s.t.}$$

$$\pi(j) > j.$$

$$E(n, k) = (n-k)E(n-1, k-1) + (k+1)E(n-1, k)$$

$$E(n, 0) = E(n, n-1) = 1$$

$$E(n, k) = \sum_{j=0}^k (-1)^j \binom{n+1}{j} (k+1-j)^n$$

5.3.4 Stirling numbers of the second kind

Partitions of n distinct elements into exactly k groups.

$$S(n, k) = S(n-1, k-1) + kS(n-1, k)$$

$$S(n, 1) = S(n, n) = 1$$

$$S(n, k) = \frac{1}{k!} \sum_{j=0}^k (-1)^{k-j} \binom{k}{j} j^n$$

5.3.5 Bell numbers

Total number of partitions of n distinct elements.

$B(n) = 1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147, \dots$ For p prime,

$$B(p^m + n) \equiv mB(n) + B(n+1) \pmod{p}$$

5.3.6 Labeled unrooted trees

on n vertices: n^{n-2}

on k existing trees of size n_i : $n_1 n_2 \dots n_k n^{k-2}$

with degrees d_i : $(n-2)! / ((d_1-1)! \dots (d_n-1)!)$

5.3.7 Catalan numbers

$$C_n = \frac{1}{n+1} \binom{2n}{n} = \binom{2n}{n} - \binom{2n}{n+1} = \frac{(2n)!}{(n+1)!n!}$$

$$C_0 = 1, \quad C_{n+1} = \frac{2(2n+1)}{n+2} C_n, \quad C_{n+1} = \sum C_i C_{n-i}$$

$$C_n = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, \dots$$

- sub-diagonal monotone paths in an $n \times n$ grid.
- strings with n pairs of parenthesis, correctly nested.
- binary trees with $n+1$ leaves (0 or 2 children).
- ordered trees with $n+1$ vertices.
- ways a convex polygon with $n+2$ sides can be cut into triangles by connecting vertices with straight lines.
- permutations of $[n]$ with no 3-term increasing subseq.
