1.7 Sqrt Tricks [8 lines] - addf19
1. Size of the block is not always Sqrt, adjust it as
    necessary. if o(n/b+b) then take n/b = b and
    calculate b.
2. MO's Algorithm
   *it is possible to solve a Mo problem without any
       remove operation. For L in one block R only
       increases, for every range we can start L from
       the last of that block
3. Sqrt Decomposition by time of queries.
   *keep overall solution and sqrt(n) updates in a
       vector and for a query iterate over all of them,
       when the vector size exceeds sqrt(n) you can add
       these updates with overall solution using o(n)
4. If sum of N positive numbers are S, there are at most
    sqrt(S) distinct values.
5. Randomization
6. Baby step, gaint step

Series	Definitions
Theoretical Computer Science Cheat Sheet	Theoretic

coprime (k+1)-tuple together with n. It is a generalization of Euler's totient, $\varphi(n) = J_1(n)$.

$$J_k(n) = n^k \prod_{p|n} \left(1 - rac{1}{p^k}
ight)$$

$$\sum_{d|n} J_k(d) = n^k$$

$$\sum_{d|n} arphi(d) = n$$

$$arphi(n) = \sum_{d \mid n} \mu\left(d
ight) \cdot rac{n}{d} = n \sum_{d \mid n} rac{\mu(d)}{d}$$

•
$$a \mid b \implies \varphi(a) \mid \varphi(b)$$

•
$$n \mid \varphi(a^n - 1)$$
 for $a, n > 1$

$$ullet \, arphi(mn) = arphi(m) arphi(n) \cdot rac{d}{arphi(d)} \quad ext{where } d = \gcd(m,n)$$

Note the special cases

•
$$\varphi(2m) = \begin{cases} 2\varphi(m) & \text{if } m \text{ is even} \\ \varphi(m) & \text{if } m \text{ is odd} \end{cases}$$

$$ullet arphi \left(n^m
ight) = n^{m-1} arphi (n)$$

$$ullet arphi(\mathrm{lcm}(m,n)) \cdot arphi(\mathrm{gcd}(m,n)) = arphi(m) \cdot arphi(n)$$

Compare this to the formula

• $lcm(m, n) \cdot gcd(m, n) = m \cdot n$

(See least common multiple.)

• $\varphi(n)$ is even for $n \ge 3$. Moreover, if n has r distinct odd prime factors, $2^r \mid \varphi(n)$

•
$$\varphi(n) = \sum_{d|n} d.\mu(\frac{n}{d})$$

•
$$\sum_{d|n} \frac{\mu^2(d)}{\varphi(d)} = \frac{n}{\varphi(n)}$$

$$ullet \sum_{\substack{1 \leq k \leq n \ (k,n)=1}} \!\! k = rac{1}{2} n arphi(n) \quad ext{for } n > 1$$

$$\frac{\varphi(n)}{n} = \frac{\varphi(\operatorname{rad}(n))}{\operatorname{rad}(n)}$$

 $n = \operatorname{rad}(n)$ where,

$$\mathrm{rad}(n) = \prod_{\substack{p \mid n \ p ext{ prime}}} p$$

• $\frac{n}{n(n)}$ is periodic. 1,2,1,2,1,3,1,2,1,2,1,3...

$$\sum_{\substack{1 \leq k \leq n \ \gcd(k,n)=1}} \gcd(k-1,n) = arphi(n) d(n)$$

• $\gcd(k,n)=1$ where d(n) is number of divisors.

same equation for gcd(ak-1,n) where a and n are coprime.
for every n there is at least one other integer m ≠ n such that φ(m) = φ(n).

Divisor function

$$\sigma_x(n) = \sum_{d|n} d^x$$

d|n

• It is multiplicative i.e. if $gcd(a,b) = 1 \Longrightarrow \sigma_x(ab) = \sigma_x(a)\sigma_x(b)$.

 Any three consecutive Fibonacci numbers are pairwise coprime, which means that, for every n, gcd(F_n, F_{n+1}) = gcd(F_n, F_{n+2}) = gcd(F_{n+1}, F_{n+2}) = 1.

If p is a prime,

$$\begin{cases} p = 5 & \Rightarrow p \mid F_p, \\ p \equiv \pm 1 \pmod{5} & \Rightarrow p \mid F_{p-1} \\ p \equiv \pm 2 \pmod{5} & \Rightarrow p \mid F_{p+1} \end{cases}$$

- The only nontrivial square Fibonacci number is 144. Attila Pethő proved in 2001 that there is only a finite number of perfect power Fibonacci numbers. In 2006, Y. Bugeaud, M. Mignotte, and S. Siksek proved that 8 and 144 are the only such non-trivial perfect powers.
- If the members of the Fibonacci sequence are taken mod n, the resulting sequence is periodic with period at most 6n.

Sum of floors

$$\begin{split} \sum_{t=1}^{n} \left\lfloor \frac{n}{t} \right\rfloor &=? \\ &\text{int32_t main()} \\ \{ &\text{BeatMeScanf;} \\ &\text{int i,j,k,n,m;} \\ &\text{cin>>n;} \\ &\text{//complexity O(sqrt(n))} \\ &\text{for (int i = 1, last; i <= n; i = last + 1)} \\ &\text{last = n / (n / i);} \\ &\text{debug(i,last,n/i);} \end{split}$$

///n / x yields the same value for i <= x <= la. } return 0;

Mobius Function and Inversion

Notes

- For any positive integer n, define μ(n) as the sum of the primitive nth roots of unity. It has values in {-1, 0, 1} depending on the factorization of n into prime factors:
 - \checkmark µ(n) = 1 if n is a square-free positive integer with an even number of prime factors.
 - ✓ $\mu(n) = -1$ if n is a square-free positive integer with an odd number of prime factors.
 - ✓ $\mu(n) = 0$ if n has a squared prime factor.

Here, a root of unity, occasionally called a de Moivre number, is any complex number that gives 1 when raised to some positive integer power n.

An nth root of unity, where n is a positive integer (i.e. n = 1,2,3,...), is a number z(maybe complex) satisfying the equation $z^n=1$.

An nth root of unity is said to be primitive if it is not a kth root of unity for some smaller k, that is if

$$z^{n} = 1$$
 and $z^{k} \neq 1$ for $k = 1, 2, 3, ..., n - 1$.

• It is a multiplicatuve function.

$$\sum_{d|n}\mu(d)=\left\{egin{array}{ll} 1 & ext{if } n=1,\ 0 & ext{if } n>1. \end{array}
ight.$$

- $\sum_{i=1}^{n} [\gcd(i,n) = k] = \varphi(\frac{n}{k})$
- $\sum_{k=1}^{n} \gcd(k,n) = \sum_{d|n} d. \ \varphi(\frac{n}{d})$
- $\sum_{k=1}^{n} \frac{1}{\gcd(k,n)} = \sum_{d|n} \frac{1}{d} \cdot \varphi\left(\frac{n}{d}\right) = \frac{1}{n} \sum_{d|n} d \cdot \varphi(d)$
- $\sum_{k=1}^{n} \frac{k}{\gcd(k,n)} = \frac{n}{2} \cdot \sum_{d|n} \frac{1}{d} \cdot \varphi\left(\frac{n}{d}\right) = \frac{n}{2} \cdot \frac{1}{n} \cdot \sum_{d|n} d \cdot \varphi(d)$
- $\sum_{k=1}^{n} \frac{n}{\gcd(k,n)} = 2 * \sum_{k=1}^{n} \frac{k}{\gcd(k,n)} 1$, for n > 1
- Given several integers, with integer x appears c_x times, and some fixed integer m. It is asked that how many integers that are co-prime to m.so,

$$\sum_{i=1}^n c_i[\gcd(i,m)=1] = \sum_{d|m} \mu(d) \sum_{i=1}^{\lfloor n/d \rfloor} c_{id}$$

The classic version states that if g and f are arithmetic functions satisfying

$$g(n) = \sum_{n} f(d)$$
 for every integer $n \geq 1$

thon

- $f(n) = \sum \mu(d) g\left(rac{n}{d}
 ight) \quad ext{for every integer } n \geq 1$
- $\sum_{d|n} \mu(d) = [n=1]$
- $\sum_{i=1}^{n} \sum_{j=1}^{n} [\gcd(i,j) = 1] = \sum_{d=1}^{n} \mu(d) \left| \frac{n}{d} \right|^{2}$
- $\sum_{i=1}^{n} \sum_{j=1}^{n} \gcd(i,j) = \sum_{d=1}^{n} \varphi(d) \left\lfloor \frac{n}{d} \right\rfloor^{2}$ $\text{if } F(n) = \prod_{i=1}^{n} f(d), \text{ then } f(n) = \prod_{i=1}^{n} F\left(\frac{n}{d}\right)^{\mu(d)}$

mobius function

int mob[N];
void mobius()

for(int i=1;i<N;i++) mob[i]=3;
mob[1]=1;
for(int i=2;i<N;i++){
 if(mob[i]==3){
 mob[i]=-1;
 for(int j=2*i;j<N;j+=i) mob[j]=(mob[j]==3?-1:mob[j]*(-1));
 if(i<=(N-1)/i) for(int j=i*i;j<N;j+=i*i) mob[j]=0;
 }
}</pre>

GCD and LCM

$$\gcd(a,0) = a$$

- $\gcd(a,b)=\gcd(b,a\,\mathrm{mod}\,b)$
- Every common divisor of a and b is a divisor of gcd(a, b).
- If a divides the product b·c, and gcd(a, b) = d, then a/d divides c.
- If m is any integer, then gcd(a + m·b, b) = gcd(a, b)
- The gcd is a multiplicative function in the following sense: if a1 and a2 are relatively prime, then gcd(a1·a2, b) = gcd(a1, b)·gcd(a2, b).
- $gcd(a, b) \cdot lcm(a, b) = |a \cdot b|$
- gcd(a, lcm(b, c)) = lcm(gcd(a, b), gcd(a, c))
- lcm(a, gcd(b, c)) = gcd(lcm(a, b), lcm(a, c)).
- For non-negative integers a and b, where a and b are not both zero,

$$gcd(n^a - 1, n^b - 1) = n^{gcd(a,b)} - 1.$$

$r_8(n) = 16 \sum (-1)^{n+d} d^3$

Gauss Circle Theorem

- The Gauss circle problem is the problem of determining how many integer lattice points there are in a circle centered at the origin and with radius r.
- Since the equation of this circle is given in Cartesian coordinates by $x^2+y^2=r^2$, the question is equivalently asking how many pairs of integers m and n there are such that
- If the answer for a given r is denoted by N(r) then

$$N(r) = 1 + 4\sum_{i=0}^{\infty} \left(\left\lfloor rac{r^2}{4i+1}
ight
floor - \left\lfloor rac{r^2}{4i+3}
ight
floor
ight)$$

• A much simpler sum appears if the sum of squares function r2(n) is defined as the number of ways of writing the number n as the sum of two squares. Then

$$N(r)=\sum_{n=0}^{r^2}r_2(n).$$

3. Combinatorics

Notes

- $\sum_{0 \le k \le n} {n-k \choose k} = \text{Fib}_{n+1}$ ${n \choose k} = {n \choose n-k}$
- $\binom{n}{k} + \binom{n-k}{n} = \binom{n+1}{k+1}$ $k\binom{n}{k} = n\binom{n-1}{k-1}$

$$\bullet \quad \binom{n}{k} = \frac{n}{k} \binom{n-1}{k-1}$$

- $\sum_{i=0}^{n} \binom{n}{i} = 2^n$

- $\sum_{i=0}^{k} (-1)^{i} \binom{n}{i} = (-1)^{k} \binom{n-1}{i}$
- $\sum_{i=0}^{k} {n+i \choose i} = {n+k+1 \choose k}$ $\sum_{i=0}^{k} {n+i \choose n} = {n+k+1 \choose k}$
- $1 \cdot {n \choose 1} + 2 \cdot {n \choose 2} + 3 \cdot {n \choose 2} + \dots + n \cdot {n \choose n} = n \cdot 2^{n-1}$
- $1^2 \cdot \binom{n}{1} + 2^2 \cdot \binom{n}{2} + 3^2 \cdot \binom{n}{3} + \dots + n^2 \cdot \binom{n}{n} = (n+n^2) \cdot 2^{n-2}$
- $\sum_{k=0}^{r} \binom{m}{k} \binom{n}{r-k} = \binom{m+n}{r}$ Vandermonde's Identity:
- Hockey-Stick

$$n,r\in\mathbb{N},n>r,\sum_{i=r}^{n}\binom{i}{r}=\binom{n+1}{r+1}$$
 entity:

- $\sum_{k=0}^{n} {n \choose k} {n \choose n-k} = {2n \choose n}$ $\sum_{k=q}^{n} {n \choose k} {k \choose a} = 2^{n-q} {n \choose a}$
- $\sum_{i=0}^{n} {2n \choose i} = 2^{2n-1} + \frac{1}{2} {2n \choose n}$
- $\sum_{i=1}^{n} {n \choose i} {n-1 \choose i-1} = {2n-1 \choose n-1}$

- An integer $n \ge 2$ is prime if and only if all the intermediate binomial coefficients $\binom{n}{1}$, $\binom{n}{2}$,..., $\binom{n}{n-1}$ are divisible by n. $\binom{n+k}{k}$ divides $\frac{lcm(n,n+1,...,n+k)}{n}$
- Kummer's theorem states that for given integers $n \ge m \ge 0$ and a prime number p, the largest power of p dividing $\binom{n}{}$ is equal to the number of carries when m is added to n-m in
- Number of different binary sequences of length n such that no two 0's are adjacent=Fib_{n+1}
- Combination with repetition: Let's say we choose k elements from an n-element set, the order doesn't matter and each element can be chosen more than once. In that case, the number of different combinations is: $\binom{n+k-1}{k}$
- Number of ways to divide n different persons in n/k equal groups i.e. each having size k is $\binom{n-1}{n-1}$
- The number non-negative solution of the equation

$$x_1 + x_2 + x_3 + ... + x_k = n$$
 is $\binom{n+k-1}{n}$

- Number of binary sequence of length n and with k '1' is $\binom{n}{k}$
- The number of ordered pairs (a, b) of binary sequences of length n, such that the distance between them is k, can be

calculated as follows:

The distance between a and b is the number of components that differs in a and b — for example, the distance between (0, 0, 1, 0) and (1, 0, 1, 1) is 2).

Catalan numbers

- \checkmark $C_n = \frac{1}{n+1} {2n \choose n}$
- \checkmark C₀ = 1,C₁=1 and $C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k}$
- ✓ 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786
- ✓ Number of correct bracket sequence consisting of n opening and n closing brackets.
- ✓ The number of ways to completely parenthesize n+1 factors.
- ✓ The number of triangulations of a convex polygon with +2 sides (i.e. the number of partitions of polygon into disjoint triangles by using the diagonals).
- ✓ The number of ways to connect the 2n points on a circle to form n disjoint i.e. non-intersecting chords.
- ✓ The number of monotonic lattice paths from point (0,0) to point (n,n) in a square lattice of size n×n, which do not pass above the main diagonal (i.e. connecting (0.0) to (n.n)).
- ✓ Number of permutations of length n that can be stack sorted (i.e. it can be shown that the

- rearrangement is stack sorted if and only if there is no such index i < j < k, such that $a_k < a_i < a_i$).
- ✓ The number of non-crossing partitions of a set of n elements.
- ✓ The number of rooted full binary trees with n+1 leaves (vertices are not numbered). A rooted binary tree is full if every vertex has either two children or no children.
- ✓ The number of Dyck words of length 2n. A Dyck word is a string consisting of n X's and n Y's such that no initial segment of the string has more Y's than X's For example, the following are the Dyck words of length 6: XXXYYY XYXXYY XYXYXY XXYYXY XXYXYY.
- ✓ The number of different ways a convex polygon with n + 2 sides can be cut into triangles by connecting vertices with straight lines (a form of Polygon triangulation)
- ✓ Number of permutations of {1, ..., n} that avoid the pattern 123 (or any of the other patterns of length 3); that is, the number of permutations with no threeterm increasing subsequence. For n = 3, these permutations are 132, 213, 231, 312 and 321. For n = 4, they are 1432, 2143, 2413, 2431, 3142, 3214, 3241, 3412, 3421, 4132, 4213, 4231, 4312 and 4321
- ✓ Number of ways to tile a stairstep shape of height n with n rectangles.

- \checkmark N(n,k) = $\frac{1}{n} \binom{n}{k} \binom{n}{k-1}$
- \checkmark The number of expressions containing n pairs of parentheses, which are correctly matched and which contain k distinct nestings. For instance, N(4, 2) = 6 as with four pairs of parentheses six sequences can be created which each contain two times the subpattern '()':

()((()))(())(())(())(()))((()()))((())())((()))(())(

The number of paths from (0, 0) to (2n, 0), with steps only northeast and southeast, not straying below the x-axis, with k peaks. And sum of all number of peaks is Catalan number.

Stirling numbers of the first kind

- ✓ The Stirling numbers of the first kind count permutations according to their number of cycles (counting fixed points as cycles of length one).
- \checkmark S(n,k) counts the number of permutations of n elements with k disjoint cycles.
- $\checkmark S(n,k) = (n-1) * S(n-1,k) + S(n-1,k-1),$ where S(0,0) = 1, S(n,0) = S(0,n) = 0
- $\checkmark \quad \sum_{k=0}^{n} S(n,k) = n!$

Stirling numbers of the second kind

- ✓ Stirling number of the second kind is the number of ways to partition a set of n objects into k non-empty
- \checkmark S(n,k) = k * S(n-1,k) + S(n-1,k-1),where S(0,0) = 1, S(n,0) = S(0,n) = 0
- ✓ $S(n,2)=2^{n-1}-1$
- ✓ S(n,k)*k! = number of ways to color n nodes using colors from 1 to k such that each color is used at least

Bell number

- ✓ Counts the number of partitions of a set.
- $\checkmark B_{n+1} = \sum_{k=0}^{n} \binom{n}{k} * B_k$
- \checkmark $B_n = \sum_{k=0}^n S(n,k)$,where S(n,k) is stirling number of
- The number of multiplicative partitions of a squarefree number with i prime factors is the ith Bell number. Bi.
- ✓ If a deck of *n* cards is shuffled by repeatedly removing the top card and reinserting it anywhere in the deck (including its original position at the top of the deck), with exactly n repetitions of this operation, then there are n^n different shuffles that can be performed. Of these, the number that return the deck to its original sorted order is exactly B_n . Thus, the probability that the deck is in its original order after shuffling it in this way is B_n/n^n .

Trees

Every tree with n

ity: If the depths of the leaves of a binary tree are d_1,\ldots,d_n :

 $\sum_{i=1}^{n} 2^{-d_i} \le 1,$

and equality holds only if every internal node has 2 sons.

Projective

coordinates:

(x, y, z), not all x,

, y and

Lucas Theorem

- ✓ If p is prime the $\binom{p^a}{b} \equiv 0 \pmod{p}$
- ✓ For non-negative integers m and n and a prime p, the following congruence relation holds:

$$\binom{m}{n} \equiv \prod_{i=0}^{k} \binom{m_i}{n_i} \pmod{p},$$

where.

 $m = m_k p^k + m_{k-1} p^{k-1} + \dots + m_1 p + m_0$

 $n = n_k p^k + n_{k-1} p^{k-1} + ... + n_1 p + n_0$

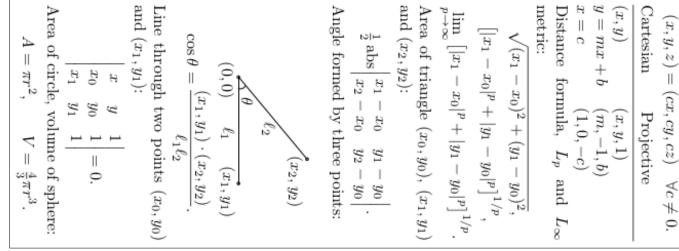

are the base p expansions of m and n respectively. This uses the convention that $\binom{m}{n} = 0$, when m < n.

Derangement

- ✓ A derangement is a permutation of the elements of a set, such that no element appears in its original
- \checkmark d(n) = (n-1) * (d(n-1) + d(n-2)),where d(0) = 1, d(1) = 0
- $\checkmark d(n) = \left|\frac{n!}{n!}\right|, n \ge 1$

4. Burnside Lemma

The task is to count the number of different necklaces from n beads. each of which can be painted in one of the k colors. When comparing two necklaces, they can be rotated, but not reversed (i.e. a cyclic shift is permitted). Solution:

24

 $\sum_{d|n} d = O(n \log \log n).$

The number of divisors of n is at most around 100 for n < 5e4, 500 for n < 1e7, 2000 for n < 1e10, 200 000 for n < 1e19.

Time: O(n)

int permToInt(vi& v) { int use = 0, i = 0, r = 0; $trav(x,v)r=r * ++i + __builtin_popcount(use & -(1 << x)),$ // (note: minus, not ~!)

5.1.2 Cycles

Let $q_S(n)$ be the number of n-permutations whose cycle lengths all belong to the set S. Then

// hash-cpp-all = elb8eaea02324af14a3da94f409019b8

$$\sum_{n=0}^{\infty} g_S(n) \frac{x^n}{n!} = \exp \left(\sum_{n \in S} \frac{x^n}{n} \right)$$

5.1.3 Derangements

Permutations of a set such that none of the elements appear in their original position.

$$D(n) = (n-1)(D(n-1)+D(n-2)) = nD(n-1)+(-1)^n = \left\lfloor \frac{n!}{e} \right\rfloor$$

5.1.4 Burnside's lemma

Given a group G of symmetries and a set X, the number of elements of X up to symmetry equals

$$\frac{1}{|G|} \sum_{g \in G} |X^g|,$$

where X^g are the elements fixed by g (g.x = x).

Sums of powers:

$$\sum_{i=1}^{n} n^{m} = \frac{1}{m+1} \sum_{k=0}^{m} {m+1 \choose k} B_{k} (n+1)^{m+1-k}$$

Euler-Maclaurin formula for infinite sums:

$$\sum_{i=m}^{\infty}f(i)=\int_{m}^{\infty}f(x)dx-\sum_{k=1}^{\infty}\frac{B_{k}}{k!}f^{(k-1)}(m)$$

$$\approx \int_{m}^{\infty} f(x)dx + \frac{f(m)}{2} - \frac{f'(m)}{12} + \frac{f'''(m)}{720} + O(f^{(5)}(m))$$

5.3.2 Stirling numbers of the first kind

Number of permutations on n items with k cycles.

$$c(n,k) = c(n-1,k-1) + (n-1)c(n-1,k), \ c(0,0) = 1$$
$$\sum_{k=0}^{n} c(n,k)x^{k} = x(x+1)\dots(x+n-1)$$

c(8, k) =8, 0, 5040, 13068, 13132, 6769, 1960, 322, 28, 1 c(n, 2) =

0, 0, 1, 3, 11, 50, 274, 1764, 13068, 109584, . . .

5.3.3 Eulerian numbers

Number of permutations $\pi \in S_n$ in which exactly kelements are greater than the previous element. k j:s s.t $\pi(j) > \pi(j+1), k+1 \text{ j:s s.t. } \pi(j) \ge j, k \text{ j:s s.t.}$ $\pi(i) > i$.

$$E(n,k) = (n-k)E(n-1,k-1) + (k+1)E(n-1,k)$$

$$E(n,0) = E(n,n-1) = 1$$

$$E(n,k) = \sum_{j=0}^{k} (-1)^{j} {n+1 \choose j} (k+1-j)^{n}$$

5.3.4 Stirling numbers of the second kind

Partitions of n distinct elements into exactly k groups.

$$S(n,k) = S(n-1,k-1) + kS(n-1,k)$$

$$S(n,1) = S(n,n) = 1$$

$$S(n,k) = \frac{1}{k!} \sum_{j=0}^{k} (-1)^{k-j} {k \choose j} j^n$$

5.3.5 Bell numbers

Total number of partitions of n distinct elements. $B(n) = 1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147, \dots$ For p prime.

$$B(p^m + n) \equiv mB(n) + B(n+1) \pmod{p}$$

5.3.6 Labeled unrooted trees

on n vertices: n^{n-2} # on k existing trees of size n_i : $n_1 n_2 \cdots n_k n^{k-2}$

with degrees d_i : $(n-2)!/((d_1-1)!\cdots(d_n-1)!)$

5.3.7 Catalan numbers

$$C_n = \frac{1}{n+1} \binom{2n}{n} = \binom{2n}{n} - \binom{2n}{n+1} = \frac{(2n)!}{(n+1)!n!}$$

$$C_0 = 1$$
, $C_{n+1} = \frac{2(2n+1)}{n+2}C_n$, $C_{n+1} = \sum C_iC_{n-i}$

 $C_n = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, \dots$

- sub-diagonal monotone paths in an n × n grid.
- strings with n pairs of parenthesis, correctly nested.
- binary trees with with n + 1 leaves (0 or 2 children).
- ordered trees with n + 1 vertices.
- ways a convex polygon with n + 2 sides can be cut into triangles by connecting vertices with straight lines.
- permutations of [n] with no 3-term increasing subseq.
